

MAD ORG. CHEM. MIN. # 9

LAST NAME \_\_\_\_\_ FIRST NAME \_\_\_\_\_

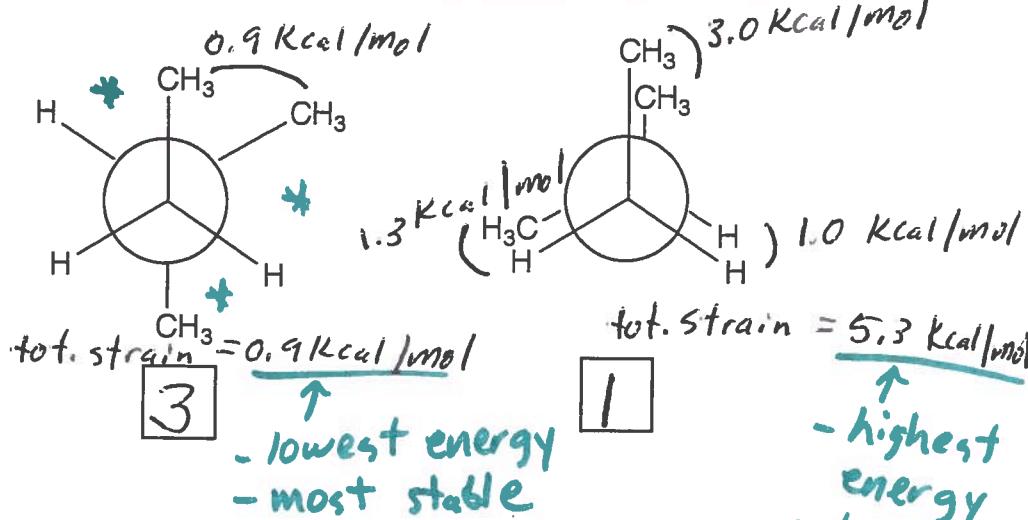

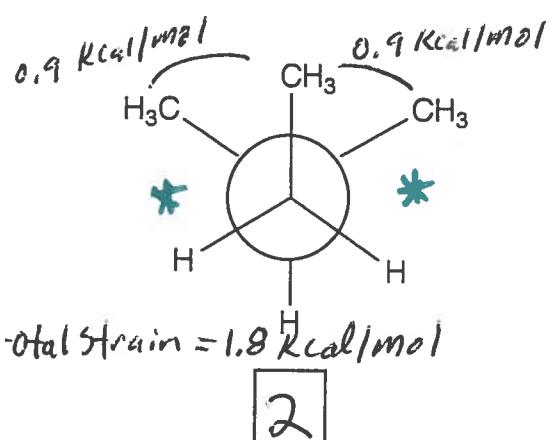

SS# \_\_\_\_\_

1. Draw the least stable conformation of pentane using a Newman projection of the view along the C<sub>2</sub> - C<sub>3</sub> bond.

- least stable because largest groups are eclipsed

2. Using the table of strain energies below, arrange the conformations of 2-methylbutane in order of increasing stability (1=least stable, 3=most stable). What is the difference in energy between the most stable and the least stable conformation?

Strain energies:

H-H eclipsing = 1 kcal/mol  
CH<sub>3</sub> - H eclipsing = 1.3 kcal/mol  
CH<sub>3</sub> - CH<sub>3</sub> eclipsing = 3.0 kcal/mol  
CH<sub>3</sub> - CH<sub>3</sub> gauche = 0.9 kcal/mol

\* There is NO CH<sub>3</sub> - H  
gauche interaction

$5.3 \text{ Kcal/mol}$   
 $- 0.9$

$4.4 \text{ Kcal/mol}$  difference in  
energy between most and  
least + 1.0.
